# The Problem and Our Proposed Solution

University students moving to or living in a university city often face practical and social challenges, especially when trying to connect with other students.

**Common student needs:**

- Finding affordable shared transport.
- Buying and selling second-hand items.
- Finding accommodation information and local resources.
- Finding compatible study partners and study communities.

**Our proposed solution:**
E-CONNEKTE is a student-oriented digital platform that brings these services together in one place.

# Our Four Main Services

1. **Mobility / Carpooling**
   Connect students travelling in similar directions to share genuine journey costs.
2. **Used Marketplace**
   Allow students to buy and sell second-hand goods and student essentials.
3. **Arrival and Living**
   Provide useful accommodation information, local resources and settling-in support.
4. **Study Groups and Study Partners**
   Help students find compatible study partners, create groups and organise study sessions.

# Proposed Technology and System Architecture

- **Website:** HTML, CSS and JavaScript, developed using Visual Studio Code.
- **Mobile application:** MIT App Inventor.
- **Database:** MySQL for storing and managing project data.
- **Backend / API:** Planned communication layer between the website, mobile app and database.
- **Collaboration:** Git and GitHub.

## Technical Objective

Develop a website and mobile application that communicate with a shared MySQL database through a backend/API.

# Project Scope and Feedback

**Initial pilot:** Cesena, Italy
**Target users:** University students, starting with classmates.

**Academic Objectives:**

- Design a relational database using MySQL.
- Develop a website and mobile application.
- Test the system using synthetic data.
- Document the design and implementation.

## Feedback Requested

1. Does the project meet module project requirements?
2. Is the proposed scope appropriate?
3. Can we proceed with project development?

**Thank you for your time and feedback!**
